Proper Method of hilling up
a rose at planting time

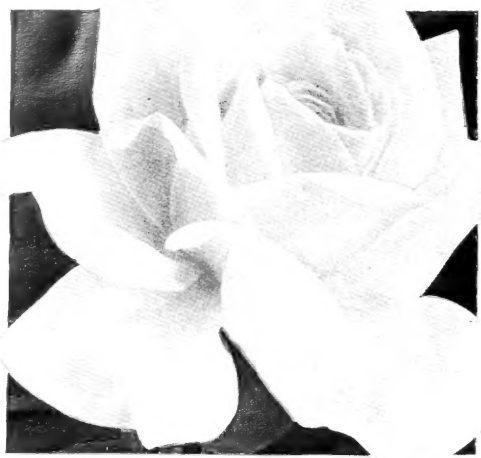

The above sketch shows the proper way to plant and hill up a Rose. Dig hole considerably larger than spread and depth of roots. Fill in enriched soil around the spread-out roots, keeping the crown or bud barely covered below the finished ground line after tramping. Water thoroughly, and hill up 6 to 8 inches of moist soil around top of plant as shown. This is very important. Completely remove this additional soil when growth starts. Ask for detailed instruction sheet on "Growing Roses the Easy Way."

Beautiful **ROSES** to Plant in Your Garden!

© REX ANDERSON

© *Peace*. Pat. 591. Here is the Rose that has been winning prizes all across the country, as well as abroad, for the past few seasons. It is the first Rose to be awarded the National Gold Medal of the American Rose Society and is rated highest by Rose Society members. Plant *Peace*, and you will agree that it is Queen of the Garden. Its enormous, beautiful blooms pass through a constantly changing range of pastel tones, each day seemingly more lovely than the last. And what is of interest to home gardeners is the fact that the plant is just as good as the bloom—sturdy, disease resistant, and bearing very leathery, dark green foliage on thick canes. **\$2.50 each.**

PICTURE

Our roses are trimmed ready for planting and individually labeled. Planting should be done only when the soil is in loose friable condition.

One of the most important things to do is bank the soil six to eight inches high, in a cone shape, around each plant until the growth starts. Then gradually work this soil down to the level of the bed.

Our plants are guaranteed, and those failing to grow will be replaced providing they are returned to us by June 1st with the original label attached and providing they are planted promptly on arrival and given good care.
